

Amendment to the Specification:

B1
Golf balls **14** and **15** are shown in phantom adjacent to the striking face **18** to indicate that clubhead **10** could strike a ball off center of the clubhead at any point along its length from the location of ball **14** to that of ball **15** without causing the ball to travel off course. As stated above, the point of impact could be even further outboard and the ball will still travel straight. As shown in Figs. 2 and 3, bar **24** is of such length that weight **26** extends rearwardly somewhat beyond the width of the main part of clubhead **10**, including soleplate **21**. Since bar **24** and weight **26** are normally threadedly engaged with clubhead **10**, weight **26** must be able to be turned into clubhead **10** without interference from soleplate **21**. With ~~with~~ different attachment means, such as welding, bar **24** could be somewhat shorter.
